Vancouver, Canada and Paris France: CTMI announced today the successful implementation of the 'Request for Proposal' (RFP) module in its CTMI-eVault project family.

The RFP module is geared towards the interchange of ideas, research results, engineering studies and the like between a government department on the one hand, and a private firm - be it small, medium-size or big - on the other - fundamentally enhancing trust between potential partners on steps in the digital supply chain.

Two modes are available in CTMI-eVault:

The first is a large-scale bulk account for a government department or utility to administer a RFP for a project, complete with auto-notarized submission by RFP business participants that of course also include digital receipts.

The second is a one-time individual account for use by the RFP business participant for the specific RFP in question, again with auto-notarized submissions that include digital receipts.
